It could therefore block dimerization of p185-HER-2. The p68HER-2 polypeptide binds to a site of the ECD of HER-2 that is different from the site of binding for Herceptin (RTM) (a marketed humanized monoclonal antibody that is used for the treatment of cancer and binds to the ECD of HER-2). The methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           carcinoma cells in culture and is found in serum of some cancer patients and may be a serum marker of metastatic breast cancer. An alternative HER-2 mRNA of 4.8 kb with a 274 bp insert (intron 8) has been identified. The retained intron is in-frame and encodes a 79 amino acid extension designated ECDIIIa (the present sequence), which is inserted at residue 340 of pla85-HER-2. The alternative mRNA predicts a truncated HER-2 protein (approximately 68 kDa) that lacks the transmembrane and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            extension designated ECDIIIa (the present sequence), which is inserted residue 340 of p185-HER-2. The alternative mRNA predicts a truncated HER-2 protein (approximately 68 kDa) that lacks the transmembrane and intracellular domains (see AAY97240.). p68HER-2 specifically binds to p185-HER-2 without activating HER-2. It could therefore block dimerization of p185-HER-2. The p68HER-2 polypeptide binds to a site of the ECD of HER-2 that is different from the site of binding for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and may be a serum marker of metastatic breast cancer. An alt HER-2 mRNA of 4.8~\rm kb with a 274~\rm bp insert (intron 8) has been identified. The retained intron is in-frame and encodes a 79~\rm kc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HER-2/neu (erbB-2) oncogene encodes a receptor-like tyrosine kinase. extracellular domain of p185-HER-2 is proteolytically shed from brea extracellular domain of p185-HER-2 is proteolytically shed from brea extracellular domain of culture and is found in serum of some cancer path

HER-2/neu (erbB-2) oncogene encodes a receptor-like tyrosine kinase. The extracellular domain of p185-HER-2 is proteolytically shed from breast carcinoma cells in culture and is found in serum of some cancer patients and may be a serum marker of metastatic breast cancer. An alternative identified. The retained intron is in-frame and encodes a 79 amino acid extension designated ECDIIIa (the present sequence), which is inserted at residue 340 of p185-HER-2. The alternative mRNA predicts a truncated HER-2 protein (approximately 68 kDa) that lacks the transmembrane and intracellular domains (see AAY97240). p68HER-2 specifically binds to p185-HER-2 without activating HER-2. It could therefore block of imerization of p185-HER-2. The p68HER-2 polypeptide binds to a site on the ECD of HER-2 that is different from the site of binding for
                                                  Herceptin (RTM) (a marketed humanized monoclonal antibody that is used for the treatment of cancer and binds to the ECD of HER-2). The methods compositions, polypeptides and antibodies are used to treat solid tumours such as breast cancer, small cell lung carcinoma, ovarian cancer.
                                                                                                                                                                                                                                                                                                Claim

                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a method for detecting a US (sub)type hepatitis E virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in usual hybridisation and amplification assays for detecting infection.
                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 10; Page 241-243; 260pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         'The invention provides a method for detecting a US (sub)type hepatitis E virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the human semaphorin Z. This protein sequence, and the rat semaphorin Z protein (see AAW19856) can be used for screening possible candidates for activity as semaphorin Z inhibitors. Proteins containing all or part of the semaphorin Z sequence are useful as central nerve extension inhibitors. Semaphorin Z inhibitors identified by screening can be used as promoters of central nerve regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Secreted protein; transmembrane protein; pro1484; pro4334; Pro

CC The present sequence represents a secreted or transmembrane polypeptide. CC The specification describes polypeptides designated PRO1484, PRO4334, CC PRO1322, PRO1889, PRO1887, PRO1887, PRO4785, PRO43537, PRO4357, PRO4405, CC PRO4356, PRO4352, PRO4380, PRO4354, PRO4408, PRO5737, PRO4425, PRO5990, CC PRO6030, PRO4424, PRO4422, PRO4430 and PRO4499, PRO1889 polypeptide is CC useful for diagnosing tumour in a mammal. The polypeptides, their CC agonists and antagonists are useful treating a condition associated with CC expression or activity of the polypeptide. Conditions treated include CC obssity, diabetes or hyper-or hypo-insulinemia. The polypeptides are CC capable of inducing proliferation of mammalian kidney mesangial cells cand are therefore useful for treating kidney disorders associated with CC and are therefore useful function such as Bergers disease or other CC nephropathies associated with Schonlein-Henoch purpura, celiac disease, CC decrmatitis herpetiformis or Crohns disease. The nucleic acids may be used to generate transgenic animals for use in development and screening of CC therapeutically useful reagents and also for chromosome identification and conditions and the conditions

          AAU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bloactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of
                                                                                                                                               Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical
                                                                                                                          Claim 12;

Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy.

The invention provides a method for detecting a US (sub)type hepatitis E virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in usual hybridisation and amplification assays for detecting infection.

                                                                                                                                                                                           This sequence represents a neurocan polypeptide. This protein has several biological activities, including cell adhesion, leukocyte-endothelial cell recognition, tissue-related inflammation allergies, cellular and/or humoural hypersensitivity, trauma, neuronal development, and cell transport and/or infection. Compositions containing them can be used as modulators of these conditions, and may be used as therapeutic, diagnostic, and/or research tools. Neurocan peptides can be used to mimic proteins, such as lectins, cell adhesion molecules, versicans, aggrecans or gelsolins, as receptor or effector subtypes. The protein can be used to treat diseases involving a qualitative or quantitative pathological abnormality of cell adhesion or leukocyte-endothelial cell recognition, or a functional masses and or leukocyte-endothelial cell recognition.

                                                                                                                                                                                                                                                                                                                                                                  virus (US-HEV), or its naturally occurring variants in a sample by treatment with a binding partner specific for a marker of the virus, and then detecting any complex formed. The method is used to diagnose infection with US-HEV. Polypeptides from US-HEV, antibodies specific for open reading frames (ORF) in US-HEV and host cells expressing these ORFs are useful in vaccines or for passive immunisation. The polypeptides are also used to raise specific antibodies (useful as immunoassay reagents). Fragments of nucleic acid from US-HEV are useful as primers and probes in usual hybridisation and amplification assays for detecting infection. The present sequence represents a HEV-US2 ORF3 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 18; Page 223; 260pp; English.

                                                                                                                                                                                                                                                                                                                                                                                         This novel 74 kDa protein is encoded by an open reading frame of a Mycobacterium tuberulosis DNA fragment (see AAT93610) containing polymorphic GC-rich sequences. Its amino acid sequence shows a high proline content, but there is no homology to any known proline-rich antigens of mycobacteria. Novel M. tuberculosis proteins (see AAM91851-57) are claimed. These can be produced as recombinant proteins, especially in bacterial, yeast, fungal or higher eukaryote host cells, and used for diagnosing tuberculosis and other mycobacterial infections in humans or animals. The claimed proteins can also be used for epidemiological studies, for monitoring vaccination, and for the development of vaccines and
                Swine HEV ORF 3 protein
                                                                                                                                                                                                                                                                                                                                                                                  anti-mycobacterial drugs.

                                                                                                                                                                                                                                                                                                                                                   can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both experimentally and clinically without fear of severe infection and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a swine hepatitis E virus (HEV) and its natural mutants which are capable of cross-reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins

                                                                                                                                                                                                                               QY
                                                                                                                                                                                                                                                                                                                                                                                                                                        to the 5602 nucleotide sequences defined in the specification, where the complementary strand of a polynucleotide which comprises one of colligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a complementary to a colligonucleotide comprises a 3'-end sequence complementary to a colligonucleotide which comprises a 3'-end sequence complementary to a colligonucleotide comprises a 3'-end sequence, where the colligonucleotide comprises at least 15 nucleotides and the combination of colligonucleotide comprises at selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in colligonucleotide comprises are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are useful for synthesising polynucleotides, collection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs casaily without any specialised methods. AAH33630 to AAH33630 and COL AAH36331 to AAH38742 represent human amino acid sequences; and AAH3629 to AAH3632 conference inventors.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

O-LINKED OLIGOSACCHARIDES (BY SIMILARITY).

IPTM: TWO ISOFORMS WERE FOUND THAT PROBABLY ARISE BY PROTEOLYTIC DEGRADATION. THE LARGE ISOFORM IS PREDOMINANT IN EARLY POSTNATAL BRAIN, THE SMALL ISOFORM IS FOUND IN ADULT BRAIN.

ISIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE V-TYPE DOMAIN.

SIMILARITY: CONTAINS 2 EGF-LIKE DOMAINS.

ISIMILARITY: CONTAINS 2 LINK DOMAINS.

ISIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.

SIMILARITY: CONTAINS 1 SUSHI (SCR) DOMAIN.

SIMILARITY: BELONGS TO THE AGGRECAN/VERSICAN PROTEOGLYCAN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBCELLULAR LOCATION: NUCLEAR.

PTM: THE TANDEM 7 RESIDUES REPEATS CAN BE HIGHLY PHOSPHORYLATED.

THE PHOSPHORYLATION ACTIVATES POL2.

MISCELLANEOUS: THREE DISTINCT ZINC-CONTAINING RNA POLYMERASES WERE FOUND IN EURARYOTIC NUCLEI: POLYMERASE I FOR THE RIBOSOMAL RNA PRECURSOR, POLYMERASE II FOR THE MENA PRECURSOR, POLYMERASE II FOR THE MENA PRECURSOR, ADLYMERASE II FOR THE MENA PRECURSOR, ADLYMERASE SILI FOR SS AND TRAN GENES.

SIMILARITY: BELONGS TO THE RNA POLYMERASE BETA' CHAIN FAMILY.

FACTOR. BEHAVES AS A NEGATIVE ELEMENT IN CIRCADIAN TRANSCRIPTIONAL
LOOP. DOES NOT APPEAR TO BIND DNA, SUGGESTING INDIRECT
TRANSCRIPTIONAL INHIBITION. EXPRESSION OSCILLATES WITH A 24 HR
RHYTHM IN THE SUPRACHIASMATIC NUCLEUS (SCN) AND THE WHOLE EYES.
OSCILLATIONS ARE MAINTAINED UNDER CONSTANT DARKNESS AND ARE
RESPONSIVE TO CHANGES OF THE LIGHT/DARK CYCLES. THERE IS A 4 HOUR
TIME DELAY BETWEEN ERRI AND PERZ OSCILLATIONS. THE EXPRESSION
RHYTHMS APPEAR TO ORIGINATE FROM RETINA (BY SIMILARITY).

-!- SUBCELULAR LOCATION: NUCLEAR (POTENTIAL).

-!- TISSUE SPECIFICITY: WIDELY EXPRESSED. FOUND IN HEART, BRAIN,
PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, KIDNEY AND PANCREAS.
-!- INDUCTION: BY LIGHT (BY SIMILARITY).

-!- SIMILARITY: CONTAINS 1 PAS (PER-ARNT-SIM) DIMERIZATION DOMAIN.
-!- SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF
                                                                                                          DOMAIN
